

RETENTION ANALYTICS · FIELD NOTE 01

Customer churn prediction

See the change early. Choose the next conversation well.

A PRACTICAL MODELING STORY

Made with GAMMA

THE QUESTION

Churn is a retention problem we can see earlier

BEFORE CANCELLATION

FROM SIGNAL TO ACTION

Customer churn is the point where a customer stops renewing or using the service.

Prediction helps the team find customers whose behavior is changing while there is still time to respond.

Who should the team contact first?

Made with GAMMA

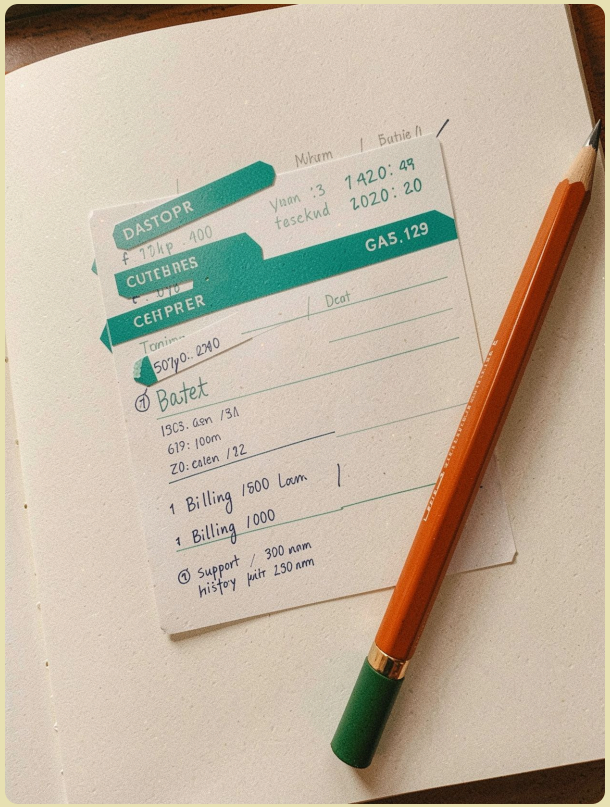

THE DATASET

The dataset turns customer history into signals

Each record combines what the customer is, what they do, what they pay, and where friction appears.

Signal family	Examples	Why it matters
Customer	Profile and tenure	Context for the relationship
Account	Plan and contract	Commitment and flexibility
Usage	Activity and frequency	Behavior that may be changing
Billing + support	Payments and contacts	Friction close to the experience

TARGET LABEL: CHURNED OR RETAINED

PROJECT VALUES

[customer count]
[time period]
[churn rate]

REPLACE PLACEHOLDERS WHEN THE PROJECT DATA IS SUPPLIED.

Made with GAMMA

BEHAVIORAL EVIDENCE

Behavior changes before the cancellation

Retention starts with a pattern the team can recognize and act on.

Usage fades

Fewer sessions, shorter visits, or a quiet feature.

Friction rises

More support contacts or unresolved issues.

Commitment shifts

Payment changes, plan moves, or weaker engagement.

Correlation is only useful when it changes the next decision.

Made with GAMMA

THE WORKFLOW

The modeling workflow keeps the prediction honest

Every step protects the distinction between a useful warning and a hindsight story.

Clean + explore

Understand fields, gaps, outliers, and the churn label.

Engineer features

Turn customer history into measurable behavior signals.

Split without leakage

Keep future information out of training and testing.

Train + interpret

Evaluate performance, then explain what drove it.

THE TEST SET MUST REPRESENT THE DECISION MOMENT

Made with GAMMA

MODEL CHOICE

Several models can answer the same question

Start simple, then earn complexity by showing a meaningful improvement.

BASELINE

Simple benchmark

A transparent reference point makes every later model accountable.

INTERPRETABLE

Logistic regression or tree

Clear relationships make the result easier to inspect and explain.

HIGHER CAPACITY

Ensemble methods

More flexible patterns may improve quality, with more explanation work.

Choose the model that balances predictive quality with business usability.

Made with GAMMA

EVALUATION

The right metric depends on the retention team

A metric is a policy choice about whose mistake costs more.

THE TRADE-OFF

Miss a likely churner

Contact a customer who stays

Precision

How many contacted customers were truly at risk?

Recall

How many likely churners did we find?

F1 score

A balance when both errors matter.

ROC-AUC

How well the model ranks risk overall.

[BEST MODEL] · [METRIC VALUES]

Made with GAMMA

THE OUTPUT

The model should rank risk, not replace judgment

A score is most useful when it helps the team decide where attention goes first.

1

Watch

Monitor the pattern and keep the relationship visible.

2

Review

Check the account context before choosing a response.

3

Act

Offer proactive support, education, or a relevant next step.

Signal → score → context → intervention

The model prioritizes. The team decides.

Made with GAMMA

EXPLANATION

Model explanations make the score usable

People act on a prediction when they can see what shaped it and what to verify.

Global drivers

Across the model, which features most influence churn predictions?

One customer

For this account, which signals pushed the score higher or lower?

Human check

Does the explanation match the customer's actual context?

EXPLANATION PANEL

Customer risk is elevated because:

Usage is declining
Recent activity is quieter than the customer's earlier pattern.

Support friction is visible
Recent contacts suggest an unresolved experience issue.

Plan behavior changed
The account context calls for a human review.

EXPLAIN BEFORE OUTREACH

Made with GAMMA

FROM PREDICTION TO PRACTICE

A useful prediction changes what the team does next

High-risk patterns become a testable set of retention plays, not an automatic discount.

Proactive support

Resolve friction before it becomes a reason to leave.

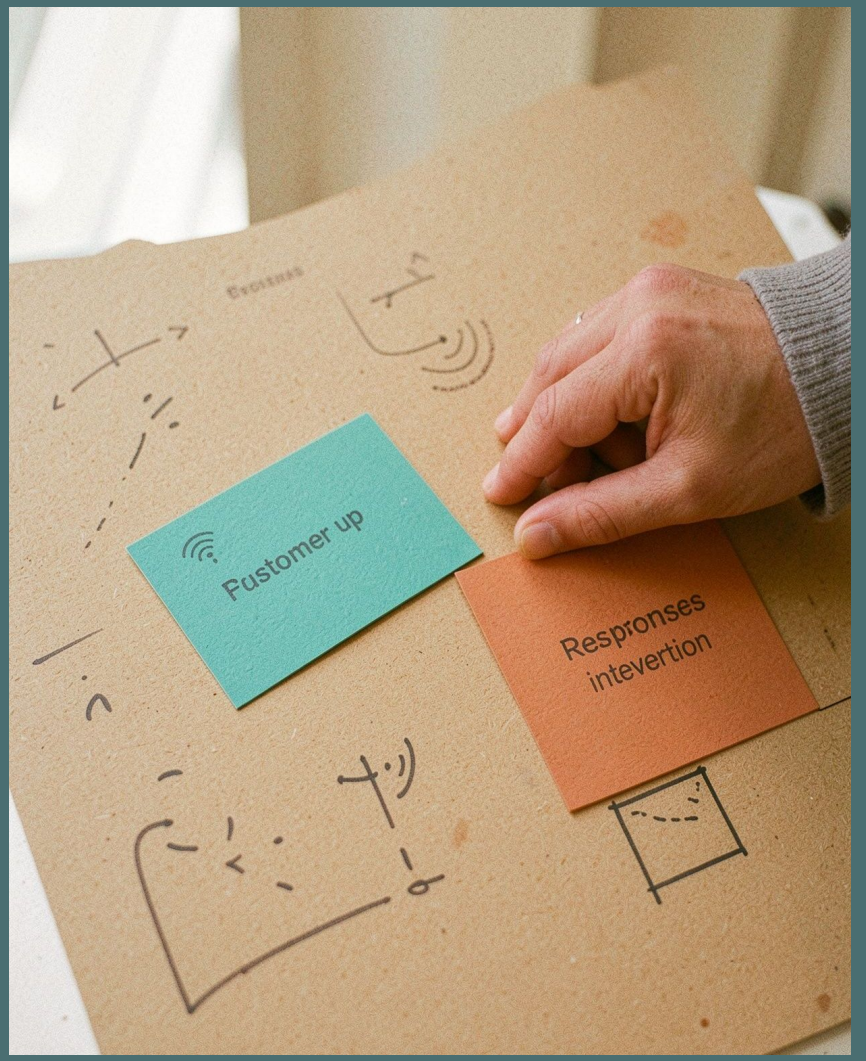

Product education

Help customers reach value they have not yet found.

Targeted offer

Use an incentive only when the context supports it.

Test each play against a control group.

MEASURE THE LOOP

Track whether interventions reduce churn without creating unnecessary discounting.
